Student Leave Management System

Problem Statement : Creation of simple student leave management system where students fill out the form to request for leave and should be able to access status of the leave and faculty should be able to approve the leave requests and reject the leave requests and admins should be able to manage users and generate reports.

Topics Going to be covered :

1. Tables
2. Users
3. Roles
4. Application menu
5. ACL
6. Modules

Users

1. Student1
2. Faculty1
3. Admin 1

Roles

1. Student_role
2. Faculty_role
3. Admin_role

Table

1. Student_leave

Table Fields

1. Leave Number
2. Student Name
3. Roll Number
4. Leave type
 - Medical
 - Personal
 - Emergency

- Family Function
 - Other
5. From Date
 6. To Date
 7. Reason
 8. Status
 - Requested
 - Approved
 - Rejected and Default value should be Requested
 9. Faculty Comments

Application menu

1. Student_leave_management

Modules

1. Create_leave_request
2. My_leaves
3. All_leave_requests
4. Reports

Process for building the project

1. Create Users, Roles , table , application menu and modules.
2. Modules like Create leave request, my leaves should be accessible to the students and admin . To do that, assign the student role and admin role to those 2 modules and give the student role to the students and admin role to the admin.
3. All leave request modules should be accessible to the faculty and admin. To do that assign faculty role to the faculty user and admin role to the admin user and also add these roles to all leave requests module.
4. Reports module should be accessible to only admin , to do that assign admin role to the admin user and reports module.

5. Now students can access the create leave request and my leaves, faculty can access all leave requests and admin can access all those modules.
6. In Create leave request form students should not be able to edit the status section , to disable the feature we should create an Acl.
7. Create an acl with write operation to status field and provide faculty role so that only faculty will have permission to edit the status field.
8. Create another acl with the same write operation but for faculty comments field because only faculty and admin should be able to edit these fields , provide roles like admin role and faculty role.
9. Now impersonate student , faculty and admin users and check whether the operations and visibility of data is correct or not.
- 10.If correct then all the roles and acls are used perfectly .
- 11.If not then check whether roles are given properly or not and try again.

Outcome OR Result

The Outcome or result of this project is

1. Better understanding of roles and ACL.
2. Better understanding about concepts like Tables, roles , application menu, users, modules etc..
